

**REMARKS**

The oath and declaration is defective. In response thereto, Applicants have amended the title to be in accordance with the present oath and declaration.

Claim 14 is objected to because of several informalities. Applicants have amended the claim 14 to address the Examiner's concerns.

Claims 1-6, 9-11, 18-22 and 29-32 are rejected under 35 USC §102(b) as being clearly anticipated by Manolatu et al., Journal of Lightwave Technology, vol. 17, no. 9, entitled "High-Density Integrated Optics."

Claim 1 recites an input port for receiving input optical signals from a first waveguide. A three dimensional interconnecting structure that receives the input optical signals and interconnects the first waveguide to a second waveguide. The three dimensional interconnecting structure includes at least four straight edges that are orthogonal and have a finite width and thickness.

Claim 9 recites an input port for receiving input optical signals from an input waveguide. A three dimensional splitting structure that receives the input optical signals and split the input optical signals into at least two separate signals that are directed to at least two output waveguides. The three dimensional splitting structure includes at least two separate optical cavities connected to their sides, wherein each of the optical cavities includes at least four straight edge sides that are orthogonal with a finite width and thickness.

Claim 29 recites a plurality of straight waveguides. A plurality of three dimensional interconnecting elements for interconnecting the plurality of straight waveguides to form the

optical resonator. The three dimensional interconnecting elements include at least four straight edges that are orthogonal and of a finite width and thickness.

Manolatu et al. describes a *two-dimensional* finite difference time domain (FDTD) simulations of low-loss right-angle waveguide bends, T-junctions and crossings, based on high index-contrast waveguides. Such structures are essential for the dense integration of optical components.

However, independent claim 1 recites a three-dimensional interconnecting structure and independent claim 29 recites three-dimensional interconnecting elements. Manolatu et al. does not address issues concerning a three-dimensional interconnecting structure. The structures described throughout Manolatu et al. are two-dimensional. Secondly, the claimed three-dimensional interconnecting structure includes a finite thickness. Given that Manolatu et al. describes two-dimensional structures, none of these structures include a thickness because of the inherent limitation that two-dimensional structures do not have a thickness because that is associated structures that are three-dimensional. Furthermore, Manolatu et al. does not explicitly state that their structures have any thickness. Therefore, the Manolatu et al. does not anticipate claims 1 and 29.

As to claims 2-6 and 30-32, they are dependent on claim 1, respectively. Therefore, claims 2-6 are also allowable for the same reasons argued with respect to claim 1.

In addition, independent claim 9 recites a three dimensional splitting structure that includes at least two separate optical cavities connected to their sides, wherein each of said optical cavities includes at least four straight edge sides that are orthogonal with a finite width

and thickness. Manolatau et al. does not address issues concerning a three-dimensional splitting structure. The splitting structures described throughout Manolatau et al. are two-dimensional. Secondly, the claimed three-dimensional splitting structure includes a finite thickness. Given that Manolatau et al. describes two-dimensional splitting structures, none of these splitting structures include a thickness because of the inherent limitation that two-dimensional structures do not have a thickness. Furthermore, Manolatau et al. does not explicitly state that their splitting structures have any thickness. Therefore, the Manolatau et al. does not anticipate claim 1.

As to claims 10-11 and 18-22, they are dependent on claim 9, respectively. Therefore, claims 10-11 and 18-22 are also allowable for the same reasons argued with respect to claim 9.

Claims 7, 12, 14-17, 23, 25-28 and 33 are rejected under 35 USC §103 as being unpatentable over Manolatau et al. in view of an article by Tang et al., IEE Proc-Optoelectro., vol. 143, no. 5, October 1996.

Tang et al. describes using silicon microelectronics fabrication methods to fabricate low-loss silicon integrated optical devices of dimensions which are compatible with single mode fibers and operate at the important wavelengths of 1.3 and 1.5  $\mu\text{m}$ .

Given that claims 7, 12, 14-17, 23, 25-28 and 33, are dependent on claims 1, 9, and 27, the reasons argued for claims 1, 9, and 27 are also applicable here. Also, Tang et al. does not address the deficiencies of Manolatau et al. Therefore, the proposed combination of Manolatau et al and Tang et al. does not render obvious claims 2, 12, 14-17, 23, 25-28 and 33.

Claims 8, 13, 24 and 34 are rejected under 35 USC §103 as being unpatentable over Manolatos et al. in view of Kitamura, US 5,949,931.

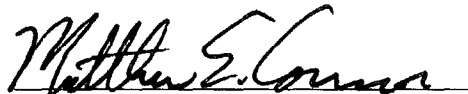

Kitamura '931 describes an optical coupler having a substrate, an optical waveguide provided on the substrate, a multimode fiber optically coupled with the optical waveguide, and a single mode fiber optically coupled with the optical waveguide.

Given that claims 8, 13, 24 and 34, are dependent on claims 9 and 27, the reasons argued for claims 9, and 27 are also applicable here. Also, Kitamura '931 does not address the deficiencies of Manolatos et al. Therefore, the proposed combination of Manolatos et al and Kitamura '931 does not render obvious claims 8, 13, 24 and 34.

In view of the above amendments and for all the reasons set forth above, the Examiner is respectfully requested to reconsider and withdraw the objection and rejections made under 35 U.S.C. §§102 and 103. Accordingly, an early indication of allowability is earnestly solicited.

If the Examiner has any questions regarding matters pending in this application, please feel free to contact the undersigned below.

Respectfully submitted,
